Publications - Ranavirus

Ranavirus is only active in warm temperatures, so dead animals found outside the summer months are more likely to have died from something else. The clearest indications that a frog population is suffering from ranaviral disease are mass mortalities of adults in or around the pond in summer, particularly if you notice frogs that are very thin or lethargic a few days before.

Ranavirus | The Amphibian and Reptile Conservation Trust

Frogs injected with undiluted viral suspension and with 10⁻² viral dilution suffered similar mortality, with the first death observed at day 10 and 100% mortality by days 14-15 . These ... Death in the clouds: Ranavirus associated mortality in assemblage of cloud forest amphibians in Nicaragua.

RANAVIRUS CAUSES MASS DIE-OFFS OF ALPINE AMPHIBIANS IN THE ...

Ranavirus infections and related mortality events have been reported in amphibians from North and South America, Europe, Africa, and Asia (Duffus et al. 2015). In North America, 43-57 % of amphibian mortality events were attributed to viral infections, presumably ranaviruses (Green et al. 2002; Muths et al. 2006). These epidemics usually occurred in mid-to-late summer and involved late stage ...

Ranavirus Ecology and Evolution: From Epidemiology to ...

The amphibian chytrid fungus (*Batrachochytrium dendrobatidis*) has driven severe amphibian declines in the Australian tropics. These declines have resulted in species extirpations and extinctions, with many surviving in small, highly threatened populations. Despite the fragility of remaining populations, another group of lethal pathogens, ranaviruses, have rarely been investigated among native ...
